ARE COVID-19 VACCINES SAFE?
- Vaccines are one of the safest and most effective ways to save lives, protect your loved ones, and help everyone return to normal.

- Every major medical study has shown that Pfizer and Moderna vaccines are safe and effective.

- The Pfizer and Moderna vaccines are Food and Drug Administration (FDA) authorized, and passed clinical trials with more than 40,000 participants, with almost 40% of the study coming from diverse populations.

- The vaccines were produced quickly, which makes some people nervous. Scientists have been studying coronaviruses for 50 years, and working on vaccines since the SARS epidemic in 2002.

- Your chance of experiencing a severe reaction to the COVID-19 vaccine is very low, less than 1%. Talk to your doctor if you have a history of allergic reactions to medicines.

- Mild side effects such as arm pain or temporary headache or fever are normal signs that your body is building protection against future infections. Most side effects go away in a few days.

- Medical experts recommend pregnant and lactating women to receive the current COVID-19 vaccines when it is available for their priority group.
